1 WhiteSpace

- 1 Unlike other programming languages, formatting in Python is done through whitespace. There are no semicolons(;) to denote the end of lines, rather simply writing the code on a new line will denote a separate command. Furtherore, the tab key is used after methods, if-then statements and loops to denote the code to be executed if the condition holds true.

```
1 def do_this():
2     print("Hello!")
3
4 if True:
5     do_this()
```

2 Data Types

2.1 Numbers

Numbers

2.2 Strings

Strings

2.3 Booleans

True and False. Capital.
